

BeCode

Quick and Simple Locker Management

The new BeCode App uses Keyless Intelligence to simplify locker management in the agile and more traditional office.

Working with the BeCode Air or BeCode Air+ RFID keyless locks, the BeCode App removes the administrative headaches caused by traditional locking devices. Saving time and money, the new device is a must for the administration of smart lockers, or for large corporates managing agile workplaces.

The App uses NFC technology to enable the operator to quickly and simply add and remove access, change a lock's status from fixed user to free mode, create a security audit trail of locker users, allow emergency opening and even set a time when all lockers are automatically open for cleaning. The App also records the battery status of each lock to aid maintenance.

The BeCode Air RFID locks operate with a keycard, or transponder such as a fob or wristband.

The lock is very easy to operate as it simply rotates to open and lock. Group access to a particular area or individual access can be easily managed and amended. Fixed users can have access to a designated locker, or temporary users in an agile environment can select and activate any free locker using their keycard or transponder device. Access to lockers can be removed immediately if a keycard

↑ Keyless locks can be operated by a keycard and via an App, which takes the hassle out of security admin

↓ Both fixed users and also those requiring temporary access can use BeCode's keyless locking system

or device is lost or if an individual leaves the company. Keycards and devices can be conveniently managed and reprogrammed onsite. You decide who can open the furniture lock and when they can do this - there is total control and complete flexibility.

BeCode AIR and AIR+ locks can be easily integrated into existing RFID environments, such as building access systems, as the lock's innovative design makes it compatible with virtually all standards. Large and complex locking systems with network functionality can automatically synchronize the data exchanged via NFC with the existing IT systems. Companies can also introduce keyless locking without replacing existing lockers as the Air+ can be retrofitted to left or right opening wooden as well as metal doors.

BeCode Keyless Intelligence is at the forefront of RFID and NFC technology. Every project is assessed to find the right bespoke solution to a company's needs.
